

Figure S1

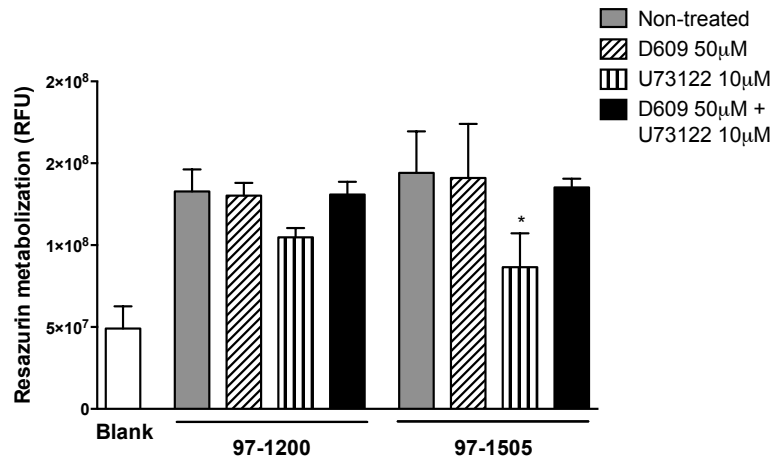

Figure S1- Viability of Mtb isolates after treatment with the PLC inhibitors D609 and U73122 Bacterial resazurin metabolization was analyzed after incubation for 1h at 37°C with the PC-PLC inhibitor D609 (50 µM), or U73122 (10 µM) or either the combination of both. Cultures were then washed three times, resuspended in RPMI media and incubated with resazurin for 24 hours. * $P < 0.05$ (one-way ANOVA). Data are representative of two independent experiments (error bars, s.e.m.).
