

Supplementary Figure 1. Effect of *Carica papaya* genomic DNA (gDNA) hybridisation on probe-pairs and probe-sets from the ATH1-121501 chip. Different values of hybridisation intensity threshold (*masks*) affect both probe-sets and probe-pairs retained. Open circles are scaled to the left side of the graphic (i.e. probe-sets used in probe mask files) while open squares are scaled to the right side (i.e. probe-pairs used in probe mask files).
