

Additional file 7

Additional file 7. The fate of *ZTLα* transcript.

Plants were grown on MS-agar plates for 10 days under normal growth conditions. Ten-day-old Col-0 plants were transferred to liquid MS culture containing 20 μ M cycloheximide (CHX). Following vacuum infiltration for 10 min, the plants were incubated for 5 h at 23°C under normal growth conditions before harvesting whole plant materials for the extraction of total RNA (left panel). The *upf1-5* and *upf3-1* mutants were not treated with CHX (right panel). Levels of *ZTLα* transcript were determined by qRT-PCR. Biological triplicates were averaged. Bars indicate standard error of the mean.
