

Legend to Figure S4: **Reduced thymidine incorporation by Rac1 suppression is the result of reduced proliferation rather than increased apoptosis.** Measurement of apoptosis using the JAM DNA fragmentation assay. Wild type PANC-1 cells (10,000 cells/well) were transiently transfected with expression plasmids for the indicated proteins. 24 h later cells were labeled with [³H]-thymidine for 3 h and subsequently exposed to TGF-β1 for 24 h. Following harvest labeled DNA was measured and the relative viability of the various transfectants was calculated. Data are the mean ± standard deviation from six wells processed in parallel. One out of two experiments is shown. *, *p*<0.05.
