

Additional file 2. Dynamics of the different cell populations in the midgut following infection with *Ecc15*.

(A) Quantitative measurements of the number of total cells and mature enterocytes at different time points following ingestion of *Ecc15*, shown relative to counts in unchallenged (UC) midguts. The number of mitotic events (measured as PH3-positive cells) at each time point is also shown. **(B)** Proportion of each cell type at different time points following infection. The different cell types were counted as described in methods and Additional file 1D.
