

Correlation analyses of 15q11-q13 copy number and transcript levels. The analysis was performed as explained in Figure 5 except only the Dup15q samples were correlated with copy number. None of the correlations were significant when the dup15q samples were separately analyzed (a-c), although positive trends were observed for *GABRB3* and *UBE3A* (a, b), but not *SNRPN* (c). Significance was calculated by a simple regression analysis.
