

Additional data file 9. Levels of MED factor occupancy and DNaseI accessibility change between developmental stages. The level of MED binding and DNaseI accessibility on the *scnf* (left), *dpp* (center), and *shn* (right) genes are shown at stages 5, 10 and 14. The figure is labeled using the same conventions in Figure 1 except that the locations of the regions above the ChIP-chip 1% FDR threshold are indicated by black horizontal lines beneath the continuous traces of ChIP-chip scores.
