

The plot below shows the number of source vectors associated with k for $k \in \{1, \dots, 8\}$. The number of possible source vectors increases exponentially as k increases. For this reason, we do not recommend using BIGRED on cases where $k > 7$ but do not anticipate many scenarios where a researcher would have sequenced a given individual more than seven times. If this scenario does occur, we discuss possible solutions in the Discussion of the main text.
