

Additional file 4: Water relations measurements of the four *Vitis* species with long-term WD maintained at 50% RSWC.

A) Stem water potential measured after 18 days of treatment on old vines of the four genotypes. B) Root hydraulic conductivity measured at day 20. For each condition (i.e. genotype x treatment), data are represented using boxplots, n = three-four individual plants. *p-value<0.05, **p-value<0.01, ***p-value<0.001; 2-way ANOVA. Red, green, blue and purple colors correspond to CS, RG, RM and SC, respectively.
