b

Supplementary Figure 1. (a) Representative picture of genotyping the TGF- β transgenic mice (samples 3,4 and 6 are transgenic, showing the 370 bp PCR product of the transgene; samples 1,2 and 5 are wild type controls). (b) Levels of circulating TGF- β_1 in wild type B6 control mice (CTL) and transgenic mice (TGF β) at the beginning of the study clearly shows that transgenic mice had 3-fold elevated plasma TGF- β_1 levels (n=14/group, p<0.001, Mann-Whitney test).
