

Additional file 3. *Effect of MTF on primary breast cancer cells with epithelial phenotype incubated with IL-6 and MTF.* MBCDF and MBCD17 primary breast cancer cell lines were seeded at 15 000 cells/cm² in a 24-well plate and incubated under the absence (control) or presence of IL-6 10 ng/mL, MTF 10 mM or the combination of IL-6 and MTF. Phase-contrast images show the density of cells in a representative field of the well at days 0, 1, 3, and 5. Magnification 10X.
