

Additional File 6 - Full-length blots of cleaved caspase-3 and GAPDH detection shown in Figure 3 A.

After the protein transfer, the nitrocellulose membrane was cut below the 30 kDa marker, and each strip was incubated with antibodies against GAPDH or Cleaved Caspase-3.

Left panel (21 % O₂): exposure times were 2 min for GAPDH, 5 min for Cleaved Caspase-3.

Right panel (3% O₂): exposure times were 2 min for GAPDH, 5 min for Cleaved Caspase-3.
