

Supplementary Fig. S1. Uncropped, original, and unprocessed images of the membrane strips corresponding to Fig. 15I. (A–C) GRP78, GAPDH, and CHOP were derived from the same membrane, which was cut horizontally according to molecular weight and probed separately with the indicated antibodies. The red boxes indicate the three lanes shown in the main figure. From left to right, the selected lanes correspond to NC, si-EGFR-AS1, and si-MAPKAPK5-AS1. The sample loading order was identical across all membrane strips. (D) A shorter-exposure image of the same GAPDH membrane strip shown in panel B is provided to address the high-contrast appearance of the GAPDH signal in the main figure.
