

Supplementary material

Rapid improvement in glycaemic control is associated with increased circulating osteocalcin in type 2 diabetes: a concise observational comparative study

Supplementary Figure 1

Supplementary Figure 1. Standalone graphical display of serum osteocalcin over 3 months by glycaemic-control group. Mean serum osteocalcin at baseline (T0) and 3 months (T3) in Group 1 (HbA1c >8.5%; intensified management) and Group 2 (HbA1c <7%; reference). Error bars indicate standard deviation. Osteocalcin values are expressed in ng/mL.
