

Supplementary Figure 1. Representative gating strategies and histograms for whole blood. **(A)** Leukocytes were gated using a linear scale FSC-A/SSC-A scatter plot with a FSC-H threshold of 150,000 to exclude red blood cell debris. **(B)** Neutrophils and monocytes were gated based on a CD14-PE/SSC-A scatter plot. **(C)** The median fluorescence intensity (MFI) of neutrophil and monocyte activation (CD11b-PE-Cy5) was determined based on histogram plots.
