

Supplementary Table S4 Comparison of 48-month Kaplan–Meier survival estimates and IPCW-adjusted Fine–Gray cumulative incidence estimates for pulpectomy failure

Analysis	Kaplan–Meier survival probability % ($\pm$ SE)	Cumulative incidence of failure % ($\pm$ SE)	RMST at 48 months ^a months ($\pm$ SE)	RMTL at 48 months ^a months ($\pm$ SE)
Kaplan-Meier estimator	52.02 (9.47)		42.77 (0.61)	
IPCW-adjusted Fine-Gray		43.07 (8.32)		5.23 (0.61)

Abbreviations: RMST, restricted mean survival time; RMTL, restricted mean time lost; SE, standard error; IPCW, inverse probability of censoring weighting.

^a RMST and RMTL were estimated from the Kaplan–Meier survival curve using a truncation time of 48 months.
