

Additional Figure S4: Selective growth advantage of AG16409 cells after XRCC1 KD at low FCS. Phase-contrast images of cells treated with Control (A, C) or XRCC1 siRNA (B, D), and grown in medium containing 5% FCS (A, B) or 2.5% FCS (C, D). Images are from one representative experiment (from a total of $n = 3$ independent experiments), with four different fields randomly chosen on each plate shown per condition. Scale bar = 400 μm .
