

Figure S2. Quantification of VHSV G mRNA by RT-qPCR from spleen (S) and head-kidney (HK) of infected fish compared to controls.

Results are normalized to housekeeping genes beta-actin, rps29 and elf1alpha. $-\Delta Cq$ values are shown. Given the high interindividual variation and the fact that the t-test value is close to the significance threshold ($p < 0.025$ after Bonferroni correction), the observed difference in G expression between AP2 and B57 spleen samples should be interpreted with caution.
