

Figure S4. Evaluation of recovery and white blood cell (WBC) depletion efficiency of the RosetteSep™ human CD45-based enrichment strategy.

a) The recovery rate was calculated as the percentage of detected cells relative to the number of cells initially spiked. Data are presented as mean ± SD. The white arrow indicates fluorescently labeled 143B osteosarcoma spiked cells. b) Percentage of WBC depletion following RosetteSep™ human CD45-based enrichment. c) Log10-transformed WBC counts before and after enrichment.
