

Supplementary Figure 1. Flow cytometry analyses of exosomes collected from supernatants of AGN-treated P19 cells. Cells were pre-treated with DMSO or 1 μ M AGN193109 for 1 hour. Following pre-treatment, the media was replaced with exosome-depleted medium, and supernatants were collected after 24 hours. Error bars show mean $\pm$ SEM. One-way ANOVA, * p <0.05, ** p <0.01. MFI = Mean fluorescence intensity.
