

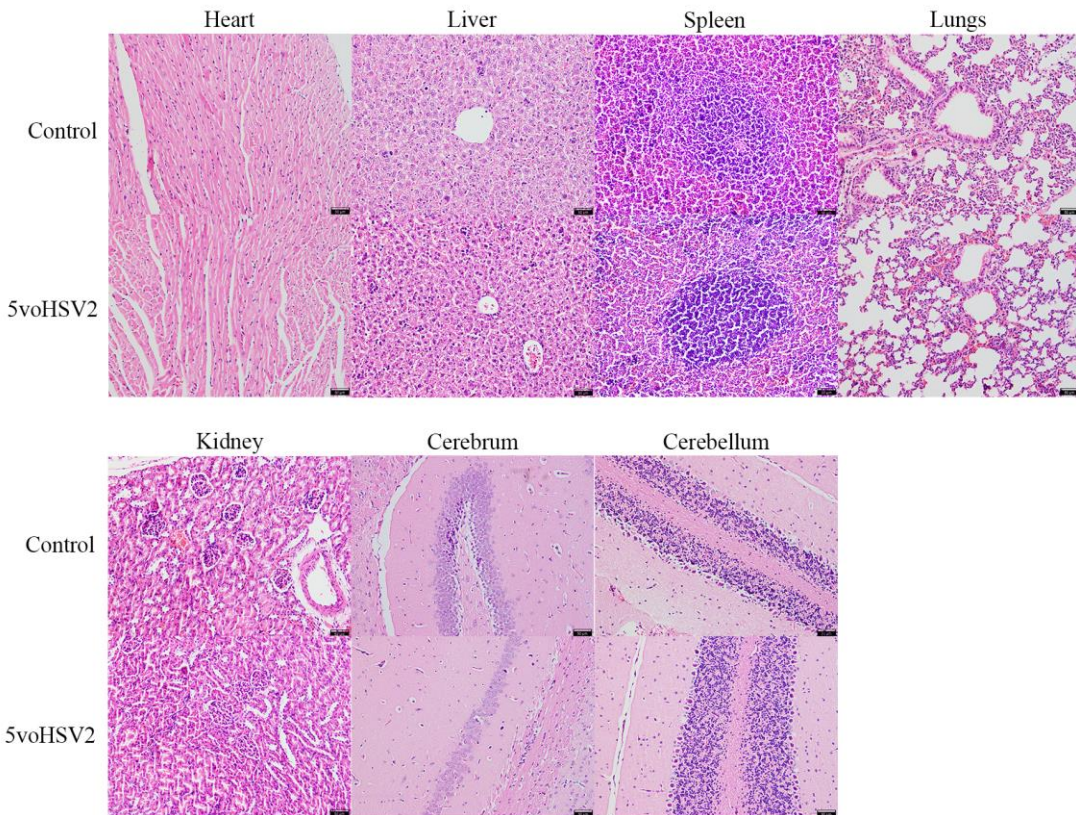

Figure S1. Histopathological analysis of murine organ tissues by hematoxylin and eosin (H&E) staining. Mice were mock treated ($n = 5$) or with 5voHSV2 ($n=5$) and sacrificed on day 7 following treatment. Different tissues were harvested, formalin-fixed, paraffinembedded, and stained with H&E. Representative photomicrographs are shown. The images were taken with a BX53 microscope and a camera under magnification $\times 20$. Each scale bar represents 50 μm .
