

Additional File 5 Fig. S5. Representative Gating strategy of EBV-reactive T cells. Lymphocytes were gated based on FSC vs. SSC pseudocolor plot (A). After exclusion of dead cells (B) and doublets (C) CD3-positive lymphocytes were gated (D). Next, the CD3-positive population was gated on the expression of CD4 (E) and CD8 (F). Subsequently, CD4⁺ and CD8⁺ T cells were analysed for the expression of the intracellular cytokines IFN-γ, TNF, and IL-2 (G and H, respectively).
