

Supplementary Figure S5

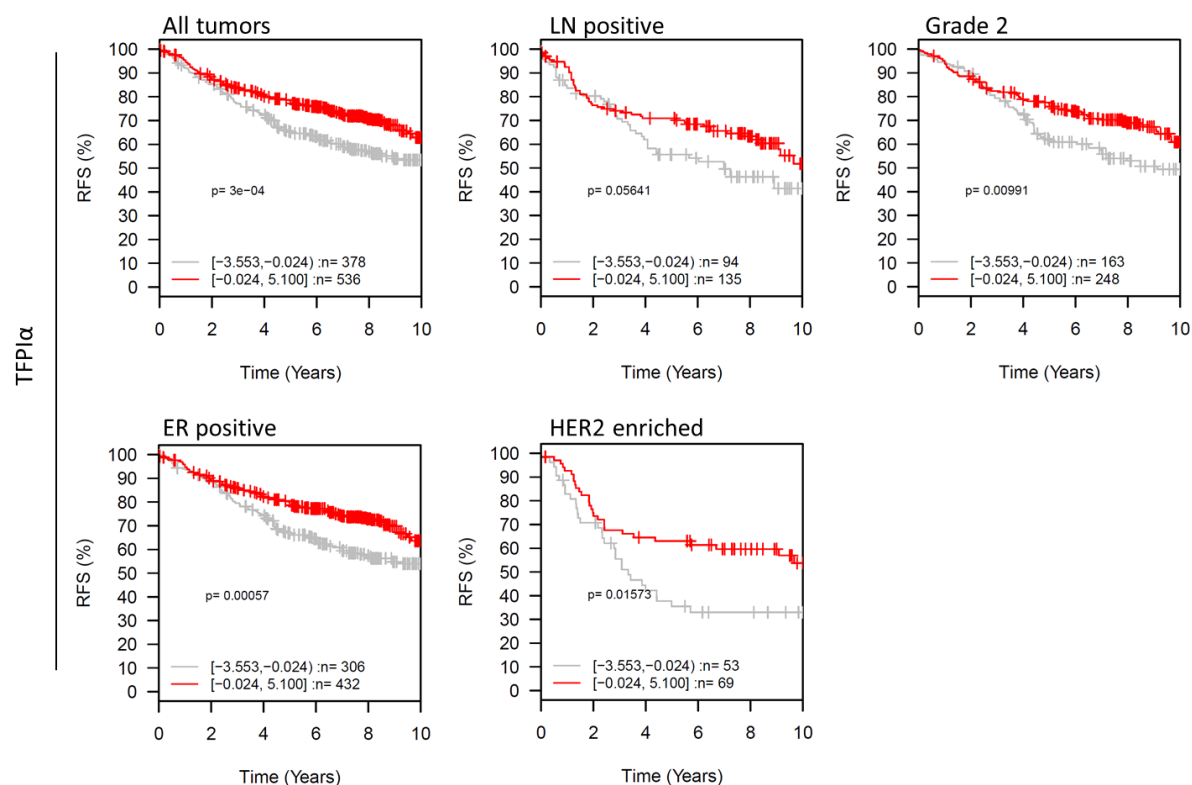

Kaplan-Meier survival curve with relapse free survival (RFS) with 10-year censoring as endpoint, stratified according to high (above the median) and low (below median) total TFPI ($\alpha+\beta$) gene expression levels (A), TFPI α gene expression levels (B), and TFPI β gene expression levels (C), in all tumors and selected clinical subgroups in which survival data was available. Analyses were performed using the GOBO database, and the log-rank test was used to calculate *P*-values.

^aFor TFPI α expression results were obtained by merging the two available probe sets, as specified in Additional file 4: Table S3.
