

Fig. S1

Mean change in lymphocyte reconstitution over a 5-year period. Absolute numbers of CD4+ T cells (A), CD8+ T cells (B) and CD19+ B cells (C) were compared between the CD34-selected group and the unmanipulated group. Error bars represent standard deviation.

Fig. S2

Mean changes in modified Rodnan skin score (mRSS; shown in A), percent predicted forced vital capacity (FVC; shown in B) and diffusing capacity of carbon monoxide (DLCO; shown in B) over an 8-year period. In the analysis of mRSS, patients with moderate-to-severe skin sclerosis (mRSS, ≥ 15) were included (n=15). Error bars represent standard deviation.
