Figure S3. Type I IFN production is induced in plasmacytoid dendritic cells (pDCs) and pDC-NK cell or pDC-B cell co-cultures from healthy blood donors stimulated with RNA containing immune complexes (RNA-IC). Levels of IFN- α in supernatants from (A) pDC and pDC-NK cells (B) pDC and pDC-B cells after 20 h of RNA-IC stimulation. No IFN- α was detected in pure NK or B cell cultures, not shown. Boxplots show medians with interquartile range for (A) seven donors (B) six donors. Wilcoxon's test. * $p < 0.05$.
