

Additional File 10, Fig.S8. Long term cDNA storage and freeze-thaw cycles do not alter lncRNA or mRNA expression. qRT-PCR gene expression data were produced for **a** - six lncRNAs and **b** - six mRNAs. Baseline cDNA was synthesized using RNA freshly isolated from PAXgene Blood RNA tubes and was compared to three treatment conditions including cDNA storage at -80°C for one year, cDNA exposed to five freeze-thaw cycles, and cDNA that was exposed to ten freeze-thaw cycles. Paired sample t-test was used to determine statistical significance. Bars represent mean Log₂(ΔΔCt) with SD for n=5 individual healthy subject's baseline cDNA samples and after one of the three treatment conditions.
