

Figure S3

Additional file 3: Figure S3. qRT-PCR analysis of N-Myc in RD cells after miR-101 overexpression or EZH2 inhibition.

(A) qRT-PCR analysis of N-Myc in RD cells infected with pS-pre-miR-101 and control pS-retrovirus. Data were normalized to GAPDH levels and expressed as fold increase over control (pS-, 1 arbitrary unit). (B) RD cells were treated with DZNep (5 μ M) or Vehicle (i.e, water, referred as untreated condition: UN). Data were normalized to GAPDH levels and expressed as fold increase over UN (1 arbitrary unit). Columns, means; Bars, SD. Results from three independent experiments are shown. * $P < 0.05$ (Student's t-test).
