

Supplemental figure 4. Lep to Angptl4 ratio during the proliferative and remodeling phases of TBI reconstruction in RCTs and osteoporosis-comorbid RCTs. The Lep/Angptl4 ratio in the tendon–bone complex at A) 2- and B) 8-week. The protein content of Lep and Angptl4 in each group is determined by ELISA and presented in Figure 3. The values of each group are normalized to the SHAM group (ratio set to one) and presented as mean $\pm$ SEM ($n_{2\text{-week}} = 7$, $n_{8\text{-week}} = 5$). ns indicates no significance ($p > 0.05$); *: $p < 0.05$; ***: $p < 0.001$.
