

Supplementary Fig. 4. Effect of GlcNAc on Gal-3 release

A. Primary wild-type myoblasts were cultured in a differentiation medium with or without 5 mM GlcNAc for 24 and 48 hours. Gal-3 released into the medium was quantified by Western blotting using an anti-Gal-3 antibody, Mac-2. The quantity of Gal-3 (arbitrary units) at 24 hours (**B**) and 48 hours (**C**) is plotted. Data represent means $\pm$ standard errors from three samples, with no statistically significant differences observed.
