

1 Additional file 5. Fig. S2. Circular representation of mycobiome communities visualized by Circos software. The outmost circles list names of
2 three groups and mycobiome community composition. The length of the bars on the second ring represented the percentage of phyla or genera in
3 three groups (left side of the diagram), and the percentage of sample in phyla or genus. The connecting lines inside the third circle link the phylum
4 or genus to the groups and the width of the line indicates the relative abundance. The outset cycles were coloured according to the software default
5 setting.
