

Additional file

Additional file 1: Figure S1 CAL-27 cells were treated with Ad-GFP, Ad-DIRAS3, rAd-p53, or Ad-DIRAS3 plus rAd-p53 for 24 h. The successful transfer of DIRAS3 or GFP genes after adenovirus infection was confirmed by examining green fluorescence using a fluorescence microscope. No fluorescence was detectable in cells treated with rAd-p53 that do not contain a GFP tag.
