Additional file 4 legend

Dissemination rate of *Aedes aegypti* and Japanese *Ae. albopictus* colonies.

The dissemination rate for each mosquito species and colony, based on the population of individual mosquitoes in which dengue virus (DENV) RNA was detected in the thorax and abdomen, is shown in the bar graph. Numbers in parentheses at the top of each bar indicate the following: (number of individuals with DENV RNA detected in the head, wings, and legs/number of individuals with DENV RNA detected in the thorax and abdomen).
