Additional File 5: Stimuli used in *Selection Experiment*

Stimuli are presented in matrices separately for self and other selections, with different network contexts presented on separate pages.

To aid perceptual comparison of profile image selections, locations of identities in the matrix correspond across pages, and most/least likely selections are presented on consecutive pages.

Masked images are of identities that did not consent to their images being used for publication. To ensure anonymity of participant data, we do not provide participant numbers associated with images here.

A full version of the Profile Image Database, enabling mapping of images to item rating data are available for use in academic research by contacting the lead author:
