

Supplementary video Aberrant PrP^d colocalises with NCAM at the ECM. Fixed chronically infected iS7 cells, treated with acetone and GTC as described in Methods were co-labelled with anti-PrP and anti-NCAM, followed by highly cross-absorbed secondary antibodies Alexa Fluor 488 anti-mouse and Alexa Fluor 568 anti-rat antibodies, respectively. Sequences of confocal images, collected at 0.64 μ m intervals are shown.
