Appendix Figure S1

Appendix Figure S1 | (a-d) A549-ACE2 cells were pretreated for 6 h with the indicated concentrations of **(a)** dexamethasone, **(b)** chloroquine, **(c)** Ipatasertib or **(d)** Marimastat (left) and Prinomastat (right), and infected with SARS-CoV-2-GFP at MOI 3. Normalized integrated GFP intensity and confluence at 72h post infection are depicted as measures of virus replication and cell growth, respectively. Plots depict mean $\pm$ sd of **(a)** 3 or **(b, c, d)** 4 independently infected wells. Statistics were calculated using Student's two-sided t-test between indicated treatment concentrations and vehicle controls. ns $p > 0.05$, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.
