Telemetric blood pressure analysis in wild type and RGS5-deficient mice

Mean (MAP), systolic and diastolic arterial blood pressure values were continuously (6 hours, every 30 min for 30 s) recorded in wild type (WT) and RGS5-deficient (RGS5^{-/-}) mice. A slight but not significant increase in these blood pressure values was observed (A-C, shown are the means±SD recorded at day- or nighttime, n.s. – not significant vs. WT mice, n=4).
