

Source data for Figure 1D. The red box indicates the cropped image used in the manuscript figure. Left panel: Western blot (WB) using anti-LC3 was imaged at 700 nm. Right panel: membrane was stripped and reblotted using anti-GAPDH and imaged at 700 nm as a loading control.

Source data for Figure 1E. Upper panel: WB using anti-GAPDH was imaged at 700 nm as a loading control. Bottom panel: WB using anti-LC3 was imaged at 700 nm. Membrane was cut between 25kD and 20kD and incubated with respective antibodies.

Source data for Figure 1F. Left panel: using dual color imaging, WB using anti-p62 was imaged at 800 nm. Right panel: the same WB using anti-GAPDH was imaged at 700 nm as a loading control.
